Home Energy Wireless Monitor
Elite Classic

**DESCRIPTION**

Our elite classic electricity monitor is simple to install and easy to use. A sensor is clipped on to the live feed of your breaker panel. A lead from the sensor and a mains adaptor are plugged into the energy transmitter, which then wirelessly sends real time data to the energy monitor. The monitor converts the data and displays the demand in kilowatts of energy being consumed at any given time. The elite classic monitor may be programmed for various rates, ensuring that the cost of your energy is accurate.

**KEY FEATURES**

- **Instant savings**
  The elite classic shows how much energy is consumed in real-time and how much it will cost if the 'energy now' load is maintained for a period of one day.

- **Average data**
  The elite classic displays your average energy usage per day, week and month. See the impact of your energy efficient efforts and then watch your average energy usage reduce.

- **Memory function**
  The elite classic memory function allows you to view your energy usage by the day, week or month.

**HOW IT WORKS**

The sensor clips on the power supply cable (phase) we want to monitor and with its jackplug, connects to one of the available ports of the transmitter. The sensor inductively measures the current passing through the wire and transfers these information to the transmitter, which are then transmitted wirelessly to the energy monitor’s display for processing and viewing.

**WIRELESS DISPLAY**

Easy to install and programm. The elite classic can be placed anywhere in the home.
